AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

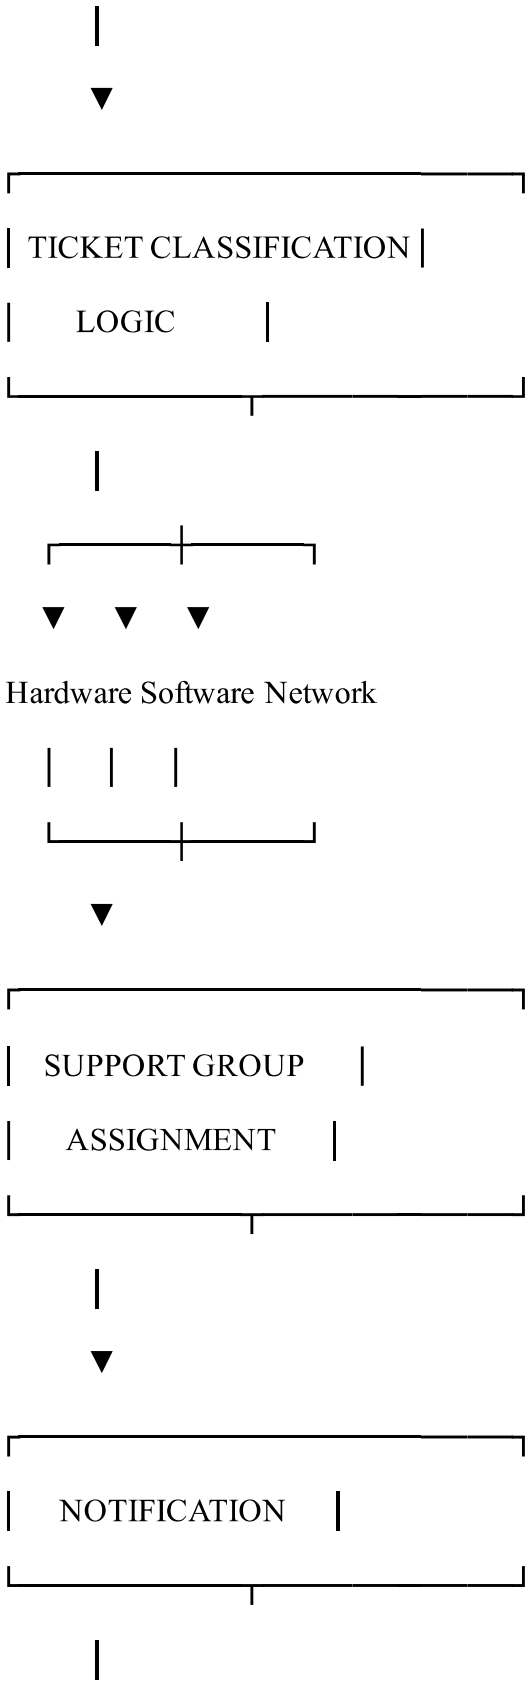

DESIGN PHASE

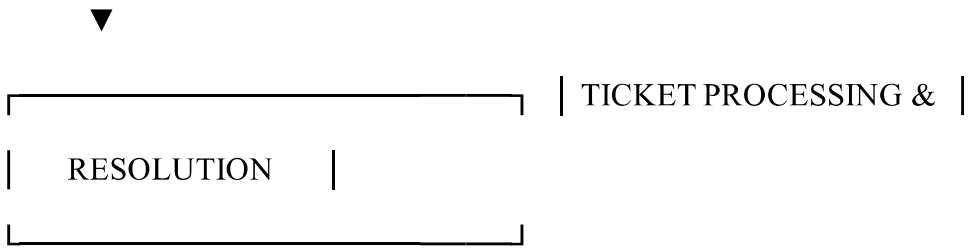

System Design

The system is designed around a workflow-based architecture. The major components involved in the system are the user, ticket management system, Flow Designer, classification logic, support group, and notification mechanism.

The basic system design is represented below:

TICKET CLASSIFICATION
LOGIC
Hardware Software Network
SUPPORT GROUP
ASSIGNMENT
NOTIFICATION

This design provides a structured path for every ticket created by the user.

User Interface Design

The user interface is designed to make ticket creation simple and user-friendly. The user should be able to create a ticket by entering the required information into the ticket form.

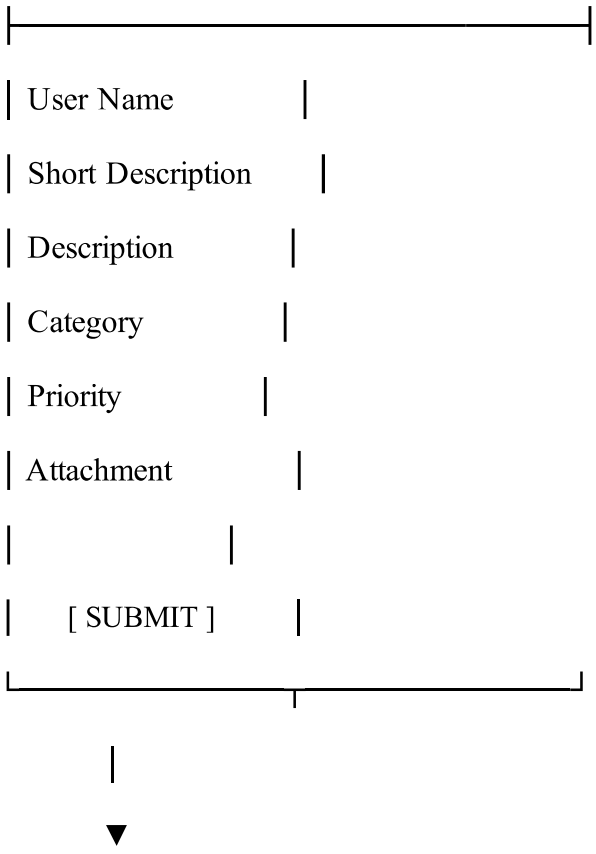

The ticket creation form may contain fields such as:

- User Name
- Short Description
- Detailed Description
- Category
- Subcategory
- Priority
- Service
- Attachment
- Contact Information

The user enters the issue details and submits the ticket. Once the ticket is submitted successfully, a unique ticket number is generated.

The basic user interaction is designed as follows:

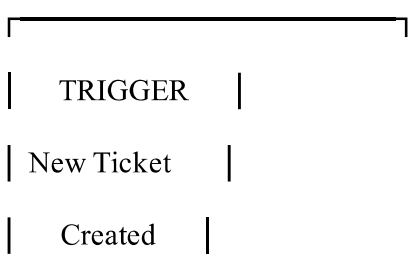

The design ensures that users can provide sufficient information for the automated classification process.

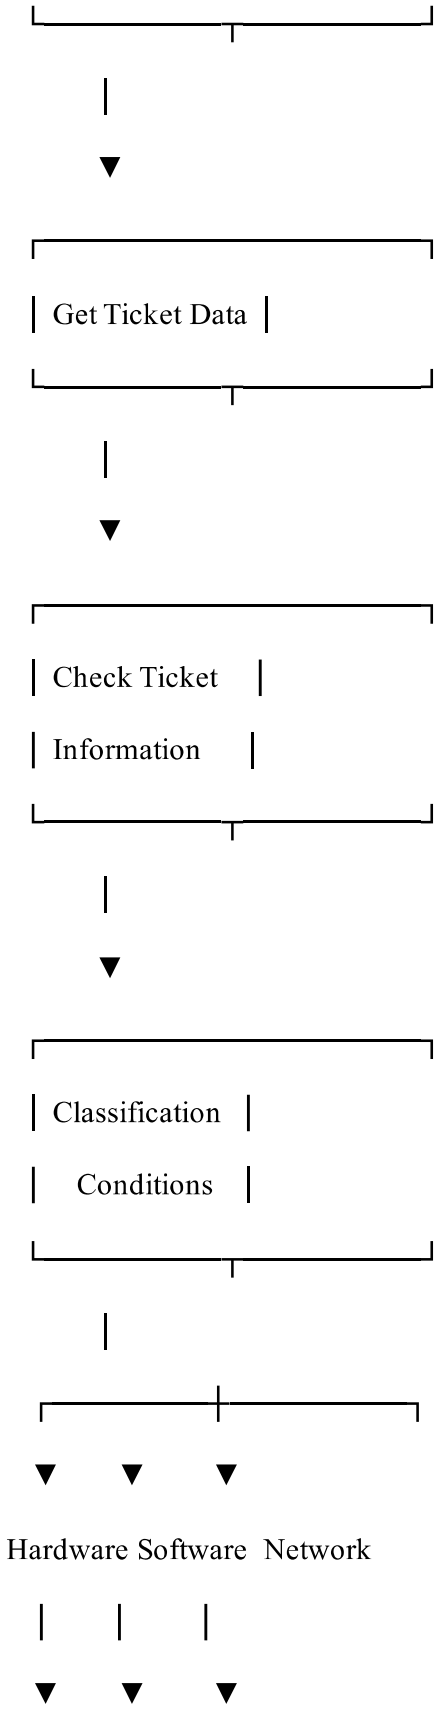

Flow Designer Design

Flow Designer acts as the main automation component of the project. It is designed to start the workflow whenever a new ticket is created.

The Flow Designer process consists of a trigger, conditions, actions, and outputs.

The overall flow is designed as:

Get Ticket Data
Check Ticket
Information
Classification
Conditions
Hardware
Software
Network

Hardware Software Network

Support Support Support

The flow is designed to automatically perform the required actions without requiring manual intervention for every new ticket.
