AUTO TICKET CLASSIFICATION USING FLOW DESIGNER
PLANNING PHASE

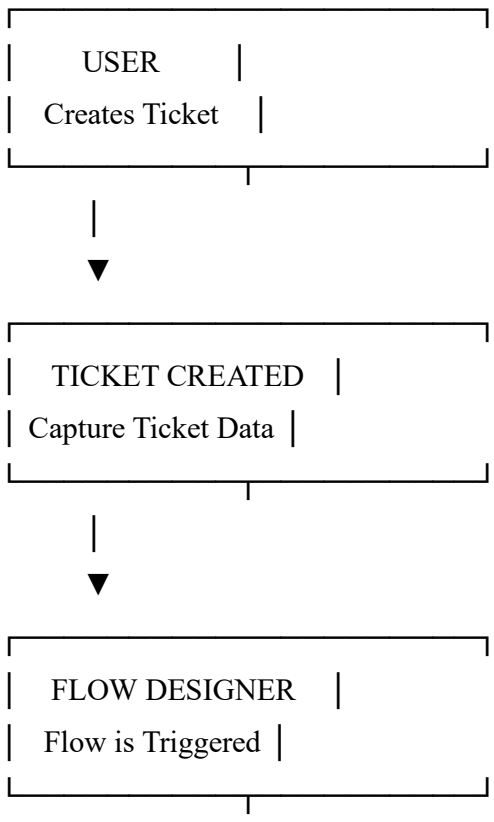

Understanding the Ticket Classification Process

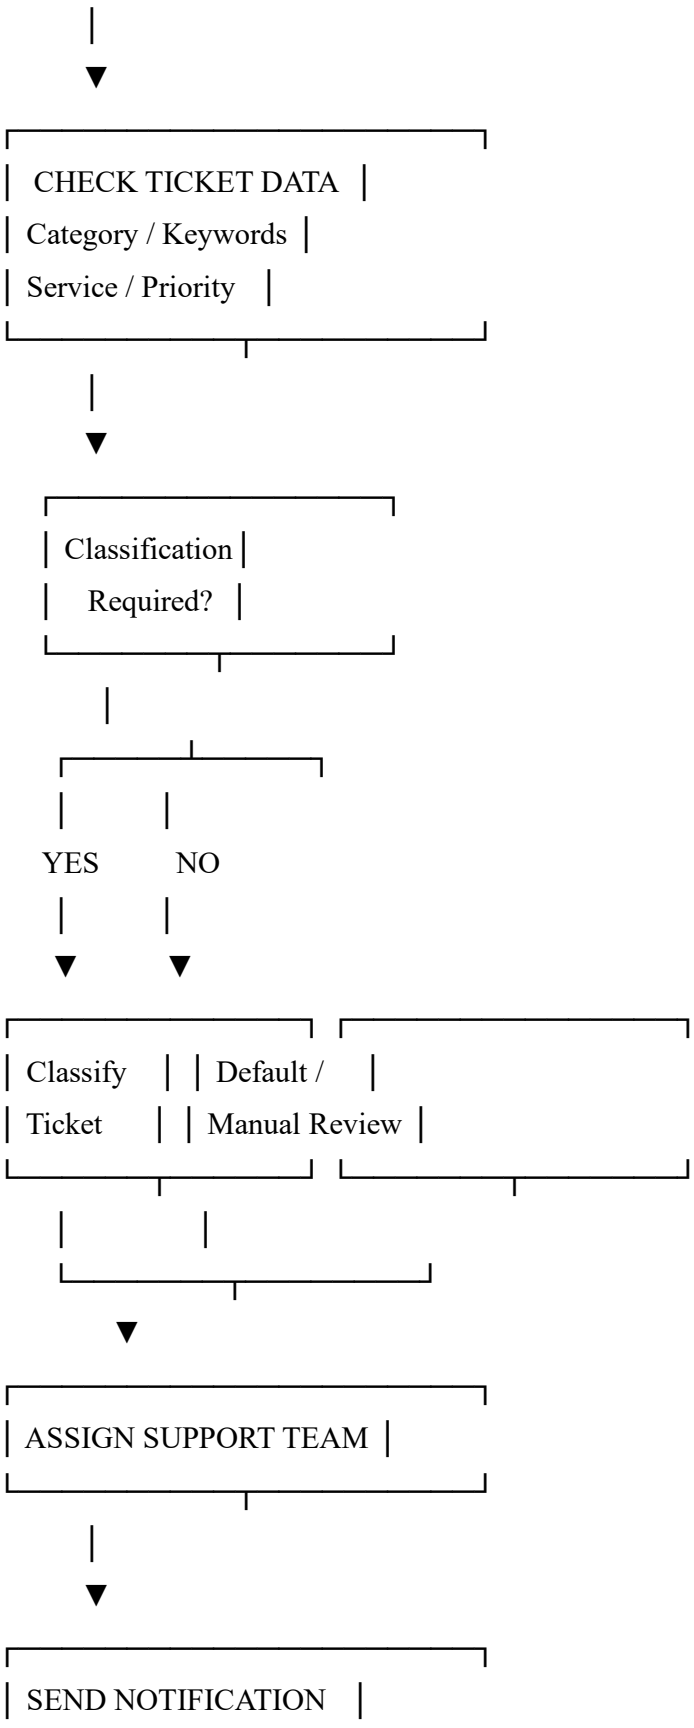

The first step in planning the project is to understand how tickets are created and processed.

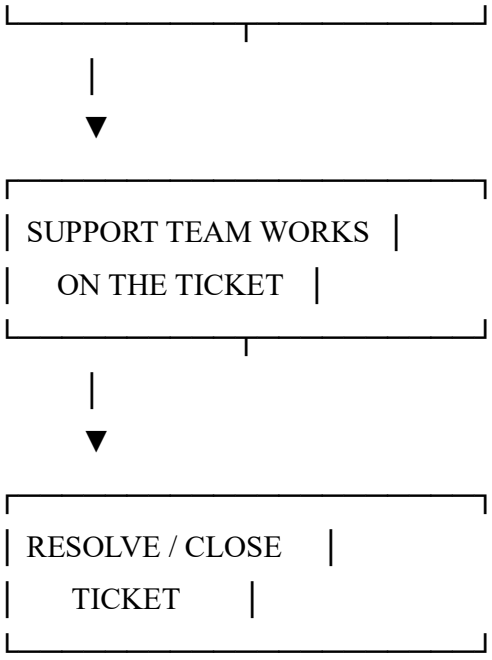

A user starts the process by submitting a ticket through the ticket management system. The ticket contains information such as the issue description, category, priority, service, and other relevant details.

Once the ticket is submitted, Flow Designer starts the automated process. The flow checks the required information and evaluates predefined conditions. Based on the matching condition, the ticket is classified and routed to the appropriate support team.

The overall process can be represented as follows:

CHECK TICKET DATA
Category / Keywords
Service / Priority
Classification
Required?
YES
NO
Classify
Ticket
Default /
Manual Review
ASSIGN SUPPORT TEAM
SEND NOTIFICATION

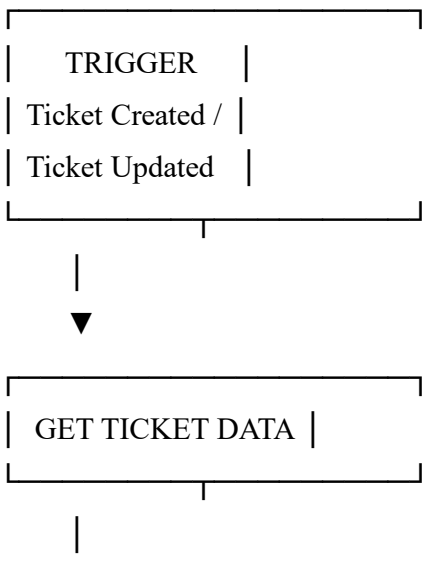

This planned workflow provides a clear sequence from ticket creation to ticket closure.

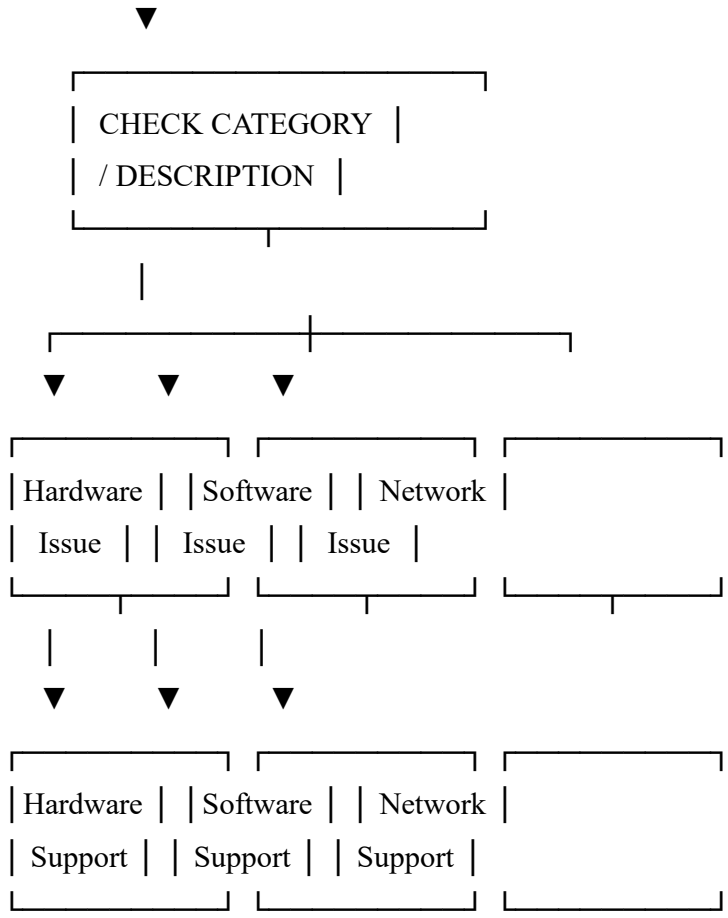

Flow Designer Planning

Flow Designer is used as the automation engine for the proposed ticket classification process.

The flow consists of a trigger, actions, conditions, and subsequent activities

The planning structure of the flow is:

The above design demonstrates how Flow Designer can evaluate different conditions and execute the corresponding actions.
